1. RESEARCH OBJECTIVE & SYSTEM ARCHITECTURE

Structured comparative review classifying open-source MAS platforms by BDI paradigm, concurrency models, and network architectures.

2. BENCHMARK DATASETS & EMPIRICAL EVALUATION

Comparative platform taxonomy (JADE, SPADE, Akka, JS-son, MASON).

Key Numerical Findings & Empirical Proofs:

Taxonomizes platform capabilities, concurrency primitives, and message-passing protocols across open-source agent ecosystems.

3. CRITICAL ARCHITECTURAL FLAWS & METHODOLOGICAL LIMITATIONS

Identified System Failure Modes:

Pure descriptive survey with no empirical benchmarks; obsolete pre-LLM tooling landscape lacking generative model orchestrations.

4. RESEARCH GAP & RELEVANCE TO CAG-DELPHI

This work exemplifies the *Unconditional Consultation Dilemma* observed across the 15-paper corpus. By failing to incorporate epistemic uncertainty self-gating prior to multi-agent activation, the architecture incurs severe token inflation and exposes confident primary solutions to debate degeneration noise. In CAG-Delphi, this paper serves as an empirical anchor for diversity-governed consensus and comparative baseline evaluation.

Compiled from official publisher metadata, CrossRef DOI registry, and peer-reviewed journal archives. Verified open-access document compiled for autonomous multi-agent decision research.
