1. RESEARCH OBJECTIVE & SYSTEM ARCHITECTURE

Multi-agent simulation of judicial bench deliberation combining professional judge agents and lay judge agents engaging in multi-round legal debate.

2. BENCHMARK DATASETS & EMPIRICAL EVALUATION

Chinese judicial lay-judge system case records for criminal judgment prediction.

Key Numerical Findings & Empirical Proofs:

Improves legal judgment accuracy, ethical fairness, and statutory consistency over single-agent baselines.

3. CRITICAL ARCHITECTURAL FLAWS & METHODOLOGICAL LIMITATIONS

Identified System Failure Modes:

Unconditional deliberation: convenes the entire judicial bench on every single case, even trivial statutory violations; single legal jurisdiction.

4. RESEARCH GAP & RELEVANCE TO CAG-DELPHI

This work exemplifies the *Unconditional Consultation Dilemma* observed across the 15-paper corpus. By failing to incorporate epistemic uncertainty self-gating prior to multi-agent activation, the architecture incurs severe token inflation and exposes confident primary solutions to debate degeneration noise. In CAG-Delphi, this paper serves as an empirical anchor for diversity-governed consensus and comparative baseline evaluation.
